Ashoke Sen

Research Summary:

My work during April 2020 - March 2021 has been mainly on the analysis of D-instanton contribution to string amplitudes. I developed a general procedure for dealing with the infrared divergences that appear in the computation of D-instanton amplitudes in string theory and showed how we can use string field theory to extract unambiguous results for these apparently divergent quantities. I used this to discuss unitarity of the D-instanton amplitudes and possible failure of unitarity when tachyonic modes are present on the D-instanton. I also used open string field theory to compute the overall normalization of the D-instanton amplitudes – a task not attempted earlier due to the infrared divergences that plague this computation.

In a separate work with Nabamita Banerjee, Ajit Bhand, Suvankar Dutta and Ranveer Singh, I showed how Bhargava's cube can be used to classify the duality orbits of the STU model.
